Formal Model

- X = set of **Customers**
- S = set of **Items**
- **Utility function** $u: X \times S \rightarrow R$
 - R = set of ratings
 - R is a totally ordered set
 - e.g., 0-5 stars, real number in $[0,1]$

A hand-drawn diagram of a utility matrix. The columns are labeled 'Avatar', 'LOTR', 'Matrix', and 'Pirates'. The rows are labeled 'Alice', 'Bob', 'Carol', and 'David'. The matrix contains the following ratings: Alice (1, 0.1, 0.2, ?), Bob (0.5, 0.3), Carol (0.2, 1), and David (0.4). Annotations include green circles around '1' and '0.2', green boxes around '0.1' and '?', and a green arrow pointing to '0.6' next to the 'Pirates' column. A purple line outlines the entire matrix area.

	Avatar	LOTR	Matrix	Pirates
Alice	1	0.1	0.2	?
Bob		0.5		0.3
Carol	0.2		1	
David				0.4

Key Problems

- **(1) Gathering “known” ratings for matrix**
 - How to collect the data in the utility matrix
- **(2) Extrapolate unknown ratings from the known ones**
 - Mainly interested in high unknown ratings
 - We are not interested in knowing what you don't like but what you like
- **(3) Evaluating extrapolation methods**
 - How to measure success/performance of recommendation methods

(1) Gathering Ratings

- **Explicit**
 - Ask people to rate items
 - Doesn't work well in practice – people can't be bothered
- **Implicit**
 - Learn ratings from user actions
 - E.g., purchase implies high rating
 - What about low ratings?

(2) Extrapolating Utilities

- **Key problem:** Utility matrix U is **sparse**
 - Most people have not rated most items
- **Cold start:**
 - New items have no ratings
 - New users have no history
- **Three approaches to recommender systems:**
 - 1) Content-based
 - 2) Collaborative
 - 3) Latent factor based

Content-based Recommendations

- **Main idea:** Recommend items to customer x similar to previous items rated highly by x

Example:

- **Movie recommendations**

- Recommend movies with same actor(s), director, genre, ...

- **Websites, blogs, news**

- Recommend other sites with "similar" content

Plan of Action

Item Profiles

- For each item, create an **item profile**
- Profile is a **set (vector) of features**
 - **Movies:** author, title, actor, director, ...
 - **Text:** Set of "important" words in document
- **How to pick important features?**
 - Usual heuristic from text mining is **TF-IDF** (Term frequency * Inverse Doc Frequency)
 - **Term ... Feature**
 - **Document ... Item**

Sidenote: TF-IDF

f_{ij} = frequency of term (feature) j in doc (item) i

$$TF_{ij} = \frac{f_{ij}}{\max_k f_{kj}} = \frac{5}{25} = 0.2$$

Note: we normalize TF to discount for "longer" documents

n_i = number of docs that mention term i

N = total number of docs

$$IDF_i = \log \frac{N}{n_i} = \log \frac{100}{2} = 1.60$$

TF-IDF score: $w_{ij} = TF_{ij} \times IDF_i = 0.2 \times 1.60 = 0.32$

Doc profile = set of words with highest TF-IDF scores, together with their scores

$$w_{ij} = 0.32 \quad j = \text{Apple}$$

User Profiles and Prediction

User profile possibilities:

- Weighted average of rated item profiles
- Variation:** weight by difference from average rating for item

Prediction heuristic:

- Given user profile $\mathbf{x}$ and item profile $\mathbf{i}$, estimate

$$u(\mathbf{x}, \mathbf{i}) = \cos(\mathbf{x}, \mathbf{i}) = \frac{\mathbf{x} \cdot \mathbf{i}}{\|\mathbf{x}\| \cdot \|\mathbf{i}\|}$$

Handwritten example: $\mathbf{x} = \mathbf{A} = [2, 3, 5]$, $\mathbf{i} = \mathbf{B} = [1, 2, 1]$

$$u(\mathbf{x}, \mathbf{i}) = \frac{2 \cdot 1 + 3 \cdot 2 + 5 \cdot 1}{\sqrt{2^2 + 3^2 + 5^2} \cdot \sqrt{1^2 + 2^2 + 1^2}} = \frac{2 + 6 + 5}{\sqrt{34} \cdot \sqrt{6}} \approx 0.71$$

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

13

Pros: Content-based Approach

- +** No need for data on other users
 - No cold-start or sparsity problems
- +** Able to recommend to users with unique tastes
- +** Able to recommend new & unpopular items
 - No first-rater problem
- +** Able to provide explanations
 - Can provide explanations of recommended items by listing content-features that caused an item to be recommended

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

14

Cons: Content-based Approach

- Finding the appropriate features is hard
 - E.g., images, movies, music
- Recommendations for new users
 - How to build a user profile?
- Overspecialization
 - Never recommends items outside user's content profile
 - People might have multiple interests
 - Unable to exploit quality judgments of other users

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

15

Based on previous problems (Content Based Cons:) a new system was introduced...

✓ Collaborative Filtering

Harnessing quality judgments of other users

✓ Collaborative Filtering

- Consider user x
- Find set N of other users whose ratings are “**similar**” to x ’s ratings
- Estimate x ’s ratings based on ratings of users in N

To be continued... (43 minutes done)

$5 \times 0.9 + 4 \times 0.8 / (5 + 4) = 4.5$

Content-Based Recommendation (Contd.)

Movies	Users				Features	
	Rim	Moon	Kim	Lee	x_1 (romance)	x_2 (action)
The Man from Nowhere	5	5	0	0	0.9	0.0
Woochi	5	?	?	0	1.0	0.01
The Good, the Bad, the Weird	?	4	0	?	0.99	0.0
Doomsday Book	0	0	5	4	0.1	1.0
White: The Melody of the Curse	0	0	5	?	0.0	0.9

Known Content Values

$\cos(B, C) = 0.8$

$\cos(B, A) = 0.9$

$0.4 = \cos(B, D)$

$0.1 = \cos(B, E)$

$K=2$

Full Calculation in Notes....

To be continued... (1 hour done)

Autonomous M2M service management system

Movies	Users				Features	
	Rim	Moon	Kim	Lee	x_1 (romance)	x_2 (action)
The Man from Nowhere	5	5	0	0	0.9	0.0
Woochi	5	?	?	0	1.0	0.01
The Good, the Bad, the Weird	?	4	0	?	0.99	0.0
Doomsday Book	0	0	5	4	0.1	1.0
White: The Melody of the Curse	0	0	5	?	0.0	0.9

Known Content Values

$$\theta_{Moon} = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \theta_2 \end{bmatrix}$$

$$X_{Woochi} = \begin{bmatrix} x_0 \\ x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1.0 \\ 0.01 \end{bmatrix}$$

$$\theta^T X = 5.0$$

$$P = 0 * 1 + 5 * 1.0 + 0 * 0.01$$

Regularization

Ridge Regression

$$L(\beta) = \min_{\beta} \underbrace{\sum_{i=1}^n (y_i - \hat{y}_i)^2}_{(1) \text{ Training accuracy}} + \underbrace{\lambda \sum_{j=1}^p \beta_j^2}_{(2) \text{ Generalization accuracy}}$$

λ : regularization parameter that controls the tradeoff between (1) and (2)

Content-Based Recommendation (Contd.)

Content-based Recommendation Algorithm

- 1) Initialize $\theta^{(1)}, \theta^{(2)}, \dots, \theta^{(N_u)}$ with small random values
- 2) Learn $\theta^{(j)}$ by solving the following optimization objective.

$$\min_{\theta^{(1)}, \theta^{(2)}, \dots, \theta^{(N_u)}} \left(\frac{1}{2} \sum_{j=1}^{N_u} \sum_{i: r(i,j)=1} \left((\theta^{(j)})^T X^{(i)} - y^{(i,j)} \right)^2 + \frac{\lambda}{2} \sum_{j=1}^{N_u} \sum_{k=1}^n (\theta_k^{(j)})^2 \right)$$

and applying gradient decent updates as follows;

$$\theta_k^{(j)} := \theta_k^{(j)} - \alpha \sum_{i: r(i,j)=1} \left((\theta^{(j)})^T X^{(i)} - y^{(i,j)} \right) X_k^{(i)} \quad (\text{For } k=0)$$

$$\theta_k^{(j)} := \theta_k^{(j)} - \alpha \left(\sum_{i: r(i,j)=1} \left((\theta^{(j)})^T X^{(i)} - y^{(i,j)} \right) X_k^{(i)} + \lambda \theta_k^{(j)} \right) \quad (\text{For } k \neq 0)$$

- 3) Predict the ratings of an unrated movie i for user j as $(\theta^{(j)})^T X^{(i)}$ using the given $X^{(i)}$ and learned $\theta^{(j)}$.

Some Calculation in Notes (Just Calculation no Implementation)....

To be continued... (1 hour 36 minutes done)

Collaborative Filtering

- Consider user x
- Find set N of other users whose ratings are "similar" to x 's ratings
- Estimate x 's ratings based on ratings of users in N

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

17

Finding "Similar" Users

$$r_x = \begin{bmatrix} * & - & - & * & *** \\ * & - & ** & ** & - \end{bmatrix}$$

- Let r_x be the vector of user x 's ratings
- Jaccard similarity measure**

Problem: Ignores the value of the rating

- Cosine similarity measure**

$$\text{sim}(x, y) = \cos(r_x, r_y) = \frac{r_x \cdot r_y}{\|r_x\| \cdot \|r_y\|}$$

Problem: Treats missing ratings as "negative"

- Pearson correlation coefficient**

S_{xy} = items rated by both users x and y

$$\text{sim}(x, y) = \frac{\sum_{s \in S_{xy}} (r_{xs} - \bar{r}_x)(r_{ys} - \bar{r}_y)}{\sqrt{\sum_{s \in S_{xy}} (r_{xs} - \bar{r}_x)^2} \sqrt{\sum_{s \in S_{xy}} (r_{ys} - \bar{r}_y)^2}}$$

r_x, r_y as points:
 $r_x = \{1, 0, 0, 1, 3\}$
 $r_y = \{1, 0, 2, 2, 0\}$

$\bar{r}_x, \bar{r}_y \dots$ avg. rating of x, y

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

18

Similarity Metric

Cosine sim:

$$\text{sim}(x, y) = \frac{\sum_i r_{xi} \cdot r_{yi}}{\sqrt{\sum_i r_{xi}^2} \cdot \sqrt{\sum_i r_{yi}^2}}$$

Similarity Metric

Cosine sim:

$$\text{sim}(x, y) = \frac{\sum_l r_{xl} \cdot r_{yl}}{\sqrt{\sum_l r_{xl}^2} \cdot \sqrt{\sum_l r_{yl}^2}}$$

	HP1	HP2	HP3	TW	SW1	SW2	SW3
A	4			5	1		
B	5	5	4				
C				2	4	5	
D		3					3

Intuitively we want: $\text{sim}(A, B) > \text{sim}(A, C)$
 Jaccard similarity: $1/5 < 2/4$
 Cosine similarity: $0.386 > 0.322$
 Considers missing ratings as "negative"
 Solution: subtract the (row) mean

	HP1	HP2	HP3	TW	SW1	SW2	SW3
A	2/3			5/3	-7/3		
B	1/3	1/3	-2/3				
C				-5/3	1/3	4/3	
D		0					0

sim A,B vs. A,C:
 $0.092 > -0.559$
 Notice cosine sim. is correlation when data is centered at 0

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

Full Math:

<https://drive.google.com/file/d/1EOuolEqEc3jzO4awQFNNegKsQ727mz6/view?usp=sharing>

5 $\text{sim}(A, B)$

Common item: HP1

Dot product

$$(2/3)(1/3) = 2/9$$

Norms

$$\|A\| = \sqrt{(2/3)^2 + (5/3)^2 + (-7/3)^2} = \sqrt{78/9}$$

$$\|B\| = \sqrt{(1/3)^2 + (1/3)^2 + (-2/3)^2} = \sqrt{6/9}$$

Similarity

$$\text{sim}(A, B) = \frac{2/9}{\sqrt{78/9}\sqrt{6/9}} \approx \boxed{0.092}$$

6 $\text{sim}(A, C)$

Common items: TW, SW1

Dot product

$$\begin{aligned} & (5/3)(-5/3) + (-7/3)(1/3) \\ & = -25/9 - 7/9 = -32/9 \end{aligned}$$

Norms

$$\begin{aligned} \|A\| &= \sqrt{78/9} \\ \|C\| &= \sqrt{(-5/3)^2 + (1/3)^2 + (4/3)^2} = \sqrt{42/9} \end{aligned}$$

Similarity

$$\text{sim}(A, C) = \frac{-32/9}{\sqrt{78/9}\sqrt{42/9}} \approx \boxed{-0.559}$$

Rating Predictions

From similarity metric to recommendations: ✓

- Let $\mathbf{r}_x$ be the vector of user x 's ratings
- Let N be the set of k users most similar to x who have rated item i
- Prediction for item i of user x :

$$r_{xi} = \frac{1}{k} \sum_{y \in N} r_{yi}$$

$$r_{xi} = \frac{\sum_{y \in N} s_{xy} \cdot r_{yi}}{\sum_{y \in N} s_{xy}}$$

Other options?

- Many other tricks possible...

Shorthand:
 $s_{xy} = \text{sim}(x, y)$

$$\begin{aligned} & = (5 + 3) / 2 = 4 \\ & \text{Shorthand: } s_{xy} = \text{sim}(x, y) \\ & = 5 * 0.9 + 3 * 0.2 \\ & = 0.9 + 0.2 \end{aligned}$$

Item-Item Collaborative Filtering

Same as Content Based Collaborative Similarity (See Notes...)

Data Set for Item-Item Collaborative Filtering....

$5 \times 0.9 + 4 \times 0.8 / (5 + 4) = 4.5$

Content-Based Recommendation (Contd.)

Movies	Users				Features	
	Rim	Moon	Kim	Lee	x_1 (romance)	x_2 (action)
The Man from Nowhere	5	5	0	0	0.9	0.0
Woochi	5	?	?	0	1.0	0.01
The Good, the Bad, the Weird	?	4	0	?	0.99	0.0
Doomsday Book	0	0	5	4	0.1	1.0
White: The Melody of the Curse	0	0	5	?	0.0	0.9

Known Content Values

$\cos(B, C) = 0.8$

$\cos(B, A) = 0.9$

$0.4 = \cos(B, D)$

$0.1 = \cos(B, E)$

$K=2$

Item-Item CF ($|N|=2$)

$K=2$

	users												
	1	2	3	4	5	6	7	8	9	10	11	12	
1	1		3		?	5			5		4		sim(1,m)
2			5	4			4			2	1	3	-0.18
3	2	4		1	2		3		4	3	5		0.41
4		2	4		5			4			2		-0.10
5			4	3	4	2					2	5	-0.31
6	1		3		3			2			4		0.59

Neighbor selection:
Identify movies similar to movie 1, rated by user 5

Here we use Pearson correlation as similarity:

- Subtract mean rating $\bar{m}_i$ from each movie i
 $\bar{m}_1 = (1+3+5+5+4)/5 = 3.6$
 row 1: [-2.6, 0, -0.6, 0, 0, 1.4, 0, 0, 1.4, 0, 0.4, 0]
- Compute cosine similarities between rows

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

24

Item-Item CF ($|N|=2$)

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

26

Problem recap (from the image)

- Method: Item-Item Collaborative Filtering
- Neighborhood size: $|N| = 2$
- Target: Predict the rating of User 5 for Movie 1 (the red ?)
- Similarity measure: Pearson correlation
- Given similarities with Movie 1:

Movie	sim(1, m)
3	0.41
6	0.59

→ These are the top 2 neighbors (highest similarities).

User 5's ratings for neighbor movies

From the table:

Movie	User 5 rating
3	2
6	3

Prediction formula (Item–Item CF)

$$\hat{r}_{u,i} = \frac{\sum_{m \in N(i)} \text{sim}(i, m) \cdot r_{u,m}}{\sum_{m \in N(i)} |\text{sim}(i, m)|}$$

Plug in the values

Numerator

$$(0.41 \times 2) + (0.59 \times 3) = 0.82 + 1.77 = 2.59$$

Denominator

$$|0.41| + |0.59| = 1.00$$

Final Answer

$$\hat{r}_{5,1} = 2.59 \approx 2.6$$

 Predicted rating of User 5 for Movie 1 ≈ 2.6

CF: Common Practice

Before:

$$r_{xi} = \frac{\sum_{j \in N(i;x)} s_{ij} r_{xj}}{\sum_{j \in N(i;x)} s_{ij}}$$

- Define **similarity** s_{ij} of items i and j
- Select k nearest neighbors $N(i; x)$
 - Items most similar to i , that were rated by x
- Estimate rating r_{xi} as the weighted average:

$$r_{xi} = b_{xi} + \frac{\sum_{j \in N(i;x)} s_{ij} \cdot (r_{xj} - b_{xj})}{\sum_{j \in N(i;x)} s_{ij}}$$

baseline estimate for r_{xi}

$$b_{xi} = \mu + b_x + b_i$$

- μ = overall mean movie rating
- b_x = rating deviation of user x
= (avg. rating of user x) - μ
- b_i = rating deviation of movie i

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

27

Mapping the formula to the previous example

Goal (same as before)

Predict the rating:

$r_{5,1}$

→ User 5 for Movie 1

1 Identify each symbol in YOUR example

Item and user

- $x = 5$ (user 5)
- $i = 1$ (movie 1)

2 Neighbors $N(i; x)$

From before:

- Top-2 similar movies to **Movie 1**
- Rated by **User 5**

$$N(1; 5) = \{3, 6\}$$

with:

- $s_{1,3} = 0.41$
 - $s_{1,6} = 0.59$
-

3 Baseline estimate b_{xi}

Formula:

$$b_{xi} = \mu + b_x + b_i$$

What it means in words:

“What rating would I expect User 5 to give Movie 1 **before** using similarity?”

In your earlier solution, we **did NOT** use **baselines**, so implicitly:

$$b_{xi} = 0$$

★ That's why the formula reduced to a **simple weighted average**.

4 Baseline-adjusted neighbor ratings

The general formula uses:

$$(r_{xj} - b_{xj})$$

In your example:

- No baseline was provided
- So:

$$b_{xj} = 0 \Rightarrow (r_{xj} - b_{xj}) = r_{xj}$$

5 Plug into the full formula

General formula:

$$r_{xi} = b_{xi} + \frac{\sum_{j \in N(i; x)} s_{ij} (r_{xj} - b_{xj})}{\sum_{j \in N(i; x)} s_{ij}}$$

Your example becomes:

$$r_{5,1} = 0 + \frac{0.41(2) + 0.59(3)}{0.41 + 0.59}$$

6 Final result (same as before)

$$r_{5,1} = \frac{2.59}{1.0} = 2.59 \approx 2.6$$

✓ Same answer

✓ Now explained using the "common practice" formula

🧠 Key insight (VERY exam-important)

- The simple weighted average formula is a special case of the baseline formula
- It happens when:
 - baselines are ignored
 - or assumed to be zero

Item-Item vs. User-User

	Avatar	LOTR	Matrix	Pirates
Alice	1		0.8	
Bob		0.5		0.3
Carol	0.9		1	0.8
David			1	0.4

- In practice, it has been observed that item-item often works better than user-user
- **Why?** Items are simpler, users have multiple tastes

Pros/Cons of Collaborative Filtering

■ + Works for any kind of item

- No feature selection needed

■ - Cold Start:

- Need enough users in the system to find a match

■ - Sparsity:

- The user/ratings matrix is sparse
- Hard to find users that have rated the same items

■ - First rater:

- Cannot recommend an item that has not been previously rated
- New items, Esoteric items

■ - Popularity bias:

- Cannot recommend items to someone with unique taste
- Tends to recommend popular items

Hybrid Methods

■ Implement two or more different recommenders and combine predictions

- Perhaps using a linear model

■ Add content-based methods to collaborative filtering

- Item profiles for new item problem
- Demographics to deal with new user problem
